

Chapter 7 Notes

Process Termination:-

Eight ways to terminate the process-

Return from main,

Calling exit,

calling `_exit` or `_Exit`,

Return of the last thread from its start routine,

calling `pthread_exit` from the last thread,

calling `abort`,

receipt of a signal,

response of the last thread to a cancellation request

`_exit` or `_Exit` which return to the kernel immediately, and `exit`, which performs certain cleanup processing and then returns to the kernel.
